TORQ-SET[®] ENGINEERING

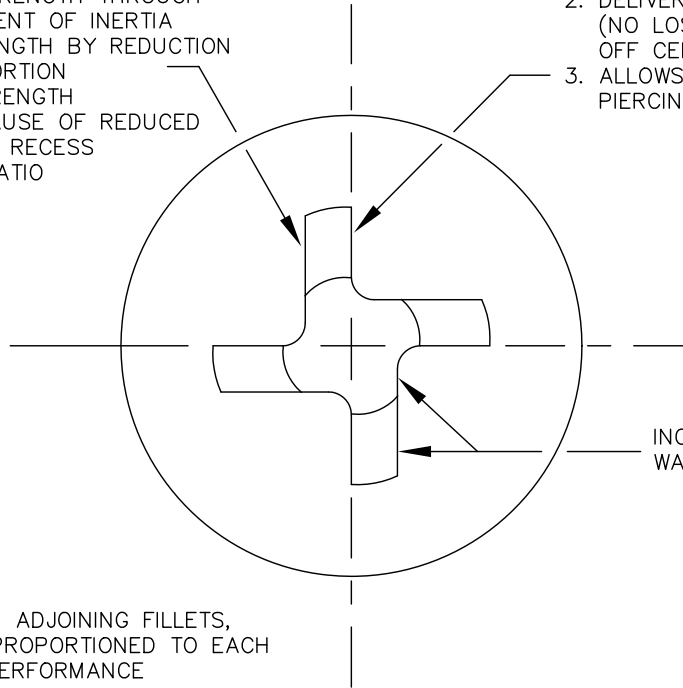

1. TORQ-SET[®] recessed head fasteners can be produced in all sizes and are currently used from #0 (.060) diameter through 5/8 (.625") diameter in various lengths and head styles. Sizes through 1-1/2 (1.500") diameter can be made as required.
2. No restriction on materials exists with the use of TORQ-SET[®] screws. Typical materials currently being produced, in addition to conventional high heat treat alloy steels, are:

A-286	302	Inconel X
17-4MO	321	Crucible "Hi-Tuf"
17-4PH	347	Greek Ascoloy
17-7PH	422	K Monel
C130AM	431	Rene' 41 & others
Titanium	H11	

3. Although the majority of Aircraft structural grade TORQ-SET[®] bolts are called out in configurations intended for basic shear load applications, the design characteristics of the recess (i.e. minimum penetration, minimal radial transition from shank to head, etc.) have proven to have excellent fatigue strength characteristics. Even in flush head configurations it has been possible (through cold working procedures) to produce TORQ-SET[®] bolts that will meet the fatigue requirements of tension type fasteners as called out in MIL-B-7838A.
4. The impact strength of any fastener, of course, varies with its mass. Another important requisite for high tensile impact strength is the uniformity of cross-sectional stress area. The displacement of material by the TORQ-SET[®] recess reduces the abrupt change in cross-sectional area at the head juncture as would be experienced in a countersunk head of more or less solid design. The improvement in tensile resilience is shown by comparing the lower (TORQ-SET[®]) curve with the upper curve for the solid head on PSC-176.
5. The above mentioned design features afford the ultimate in tensile strength, torsional load carrying ability, and impact resistance.

OFFSET WINGS FOR

1. GREATER DRIVER STABILITY
2. INCREASED DRIVER STABILITY THROUGH GREATER POLAR MOMENT OF INERTIA
3. IMPROVED HEAD STRENGTH BY REDUCTION OF CUPPING OR DISTORTION
4. GREATER FATIGUE STRENGTH
5. EASIER HEADING BECAUSE OF REDUCED RADIAL FLOW, BETTER RECESS DIAMETER TO ROOT RATIO

RADIAL DRIVING WALLS

1. GIVE SURFACE CONTACT WITH BIT
2. DELIVER FULL APPLIED TORQUE (NO LOST COMPONENT DUE TO OFF CENTER TIGHTENING)
3. ALLOWS BETTER MATERIAL FLOW FOR PIERCING STRAIGHT WALLED RECESS

INCREASED AREA OF REMOVAL
WALL FACILITATES LOOSENING

NOTE:

RECESS WING THICKNESS, ADJOINING FILLETS, AND PENETRATION ARE PROPORTIONED TO EACH SCREW SIZE FOR BEST PERFORMANCE

WIDE OUTER WINGS

1. LOCATE CENTER OF PRESSURE FURTHER FROM CENTER LINE WITH REDUCED UNIT STRESS
2. PROVIDE FOR STRONGER BIT
3. BETTER GRAIN FLOW

PHONE: 774-396-6190 FAX: 508-966-2326

PHILLIPS II® PHILLIPS® POZIDRIV® ACR® POZISQUARE® PHILLIPS SQUARE-DRIV® TORQ-SET® TRI-WING® MORTORQ®
HEXSTIX® POZILOCK® ARE REGISTERED TRADEMARKS OF THE PHILLIPS SCREW COMPANY

The following minimum torque values are established for the inspection of the Torq-Set[®] recessed head screws of all head styles, in typical materials of 160KSI strength level and higher, with normal coatings and finishes.

The test procedure shall be in accordance with PSC-395A.

(1) the end load in paragraph 3a is 15.0 pounds, and (2) the bit wing thicknesses "F" are in accordance with PSC-170. Bits used for testing shall meet the appropriate requirements and shall not show evidence of distortion or deformation.

RECESS SIZE	CLOCKWISE TORQUE (DRIVING DIRECTION)	COUNTER-CLOCKWISE-TORQUE (REMOVAL DIRECTION)
0	not established at this time	
2	4 1/2 IN-LBS	2 1/2 IN-LBS
4	14	10
6	30	26
8	50	40
10	70	50
1/4	180	145
5/16	270	230
3/8	600	430
7/16	925	725
1/2	1250	1050
9/16	1750	1400
5/8	not established at this time	

ACCEPTANCE CRITERIA

1. No burrs or raises of metal are permitted on the driving edges of the recess allowing the application of the clockwise torque values listed. Minor surface scraping or "bruising" is permitted.
2. Burrs or raises of metal up to .003 are permitted on the removal wings of the recess following the application of the counterclockwise torque values listed.

LIMITATION

1. Screws with drilled heads are not subject to recess torque tests.

TORQUE TESTING PROCEDURE FOR TORQ-SET® SCREW PRODUCTS

SCOPE:

This specification covers torque testing procedures for TORQ-SET® screws, and should serve as a guide for all Quality Control Inspection personnel responsible for the acceptance and performance of TORQ-SET® products.

A. APPLICABLE SPECIFICATIONS AND PUBLICATIONS:

The following specifications and publications shall form a part of this specification.

1. TORQ-SET® Engineering Manual – P.S.C.:

- a. SG-112 – TORQ-SET® Recess Gage (Go and NoGo).
- b. SG-112A – TORQ-SET® Penetration Values.
- c. SG-147 – TORQ-SET® Curved Top Head Dial Indicator Fallaway Gage.
- d. SG-137 – TORQ-SET® Penetration Gage.

2. Test Equipment:

- a. Sturtevant Torque Tester, Model #TTF-1/4, #TTF-1/2, or equivalent with special adaptor.
- b. Sturtevant or equivalent calibrated torque wrenches, with range from:

0-50	in-lbs	F-50-1
0-100	"	F-100-1
0-600	"	S-600-1
0-1200	"	S-1200-1

HEXSTIX® POZILOCK® ARE REGISTERED TRADEMARKS OF THE PHILLIPS SCREW COMPANY

3. Bits:

- a. All TORQ-SET® driver bits used for torque testing shall meet the dimensional requirements of PSC-170 and the physical requirements of QC-37C except that impact testing per paragraph 3 is not a mandatory requirement.
- b. Bits are to be discarded when signs of wear or when rounded edges appear on the driving or removal walls.

B. PROCEDURES:

1. Test Specimens:

TORQ-SET® screws shall meet the dimensional and physical requirements of Section A1 of this specification prior to torque testing. Test specimens shall be selected at random from production lots in a manner that will eliminate the possibility of stratification.

2. Specimen Mounting:

Specimen being tested is to be affixed to the test fixture in a vertical manner that will assure alignment with the mating driver bit, and held rigidly enough to prevent rotation when subjected to torque loading beyond the physical strength of the test specimen. It also should be held as close as possible to the head shank junction, thus minimizing the chance of misalignment.

3. Weights and Adaptors:

- a. The specimen mating driver bit, torque delivery shaft, adaptors, torque wrench and additional affixed weights shall be 15.00 pounds.
- b. Engage the mating driver bit with the specimen recess. Care should be taken to ensure axial alignment of the driver with the test specimen. Care should also be taken to assure that the specimen has been subjected to full weight allowables as outlined in Paragraph 3a above.
- c. Torque loads shall be delivered both clockwise and counter-clockwise, beginning with the counter-clockwise direction. It is recommended that the specimen being tested only be subjected to the minimum torque requirements, as set forth herein.

TORQ-SET[®] DRIVER BITS AND ADAPTERS

The TORQ-SET[®] bits being the counterpart of the recess, offer one of the best possible designs for the delivery of torque. The offset wing yields over twenty percent increase in the section modulus of the bit, which is reflected in a corresponding increase in the torque strength of the bit, compared to a symmetrical design, without increasing the wing thickness or other dimensions.

Because of its simple shank construction, TORQ-SET[®] bits are adaptable to all power and hand driving tools. TORQ-SET[®] bits are produced with 1/4, 5/16, 7/16, 5/8 hexagon shanks adaptable directly to all common power screw-drivers.

Hand tightening may be employed by the direct use of open end or box wrenches. For more precise torque control, standard torque wrenches may be used with the adaptors on PSC-170A or with 12 point sockets.

QUALITY CONTROL SPECIFICATION #37C

Procedure for inspection and impact testing of TORQ-SET® bits.

I. PURPOSE

This specification outlines the procedures, sampling plans, and minimum requirements for the inspection of TORQ-SET® bits. It is intended for the use of the Inspection Department in checking finished lots of bits before they are accepted into stock.

II. MATERIAL COVERED BY THIS SPECIFICATION

This applies to all lots of TORQ-SET® power driver bits and hand driver insert bits. Any specially modified bit configuration other than those covered by the following Phillips Screw Company documents must be reviewed by the Phillips Screw Company.

TORQ-SET® hand drivers (PSC-268) are also to be inspected to the requirements of this specification, except that they will not be impact tested. Torque testing will be performed on the hand driver blade only. Handle to be tested to ANSI B107.4 or Federal Spec. GGG-S-121.

III. SAMPLING, TEST PROCEDURES AND SPECIFICATION REQUIREMENTS

The following inspections will be performed on each lot of finished bits submitted for test. A lot is defined as a group of bits of the same size and type received at the same time. Grouping of lots (different sizes or types, or same size and type but different receipt dates) is not permitted.

A. Dimensional Characteristics and General Appearance

- Count bits – up to 200 pcs. hand count.
Over 200 pcs. – scale count using small bench scale.
- Inspect for burrs, proper part number, size, manufacturer's name, symbol, or code, and general appearance.
Up to 200 pcs. – 100% check.
Over 200 pcs. – Use sampling plan .25% AQL.
- Gage using sampling plan .25% AQL and gage per PSC-776.
- Check wing thickness (F dimension) of each wing using sampling plan 1.0% AQL inspection level L8.

5. Check other dimensions including point angle, hex size, and overall length per proper prints and check effectiveness of retaining grooves.
Up to 200 pcs. - check 10 pcs.
Over 200 pcs. - check 15 pcs.

Effectiveness of retaining groove can be checked by inserting bits in a driver socket and verifying that they enter the socket reasonably well, are retained securely, and will dissengage easily. A detailed dimensional check of the retaining grooves is not required.

B. Physical Test Requirements

TORSIONAL STRENGTH REQUIREMENTS FOR TORQ-SET® BITS

The following represents minimum torque strength values to be expected from TORQ-SET® bits and hand driver blades when tested in hardened (Rc 61–63) test blocks having recess dimensions per flat fillister head tabulations on PSC-430 and sheet 5. The torque test fixture used shall be capable of preventing any axial movement of the bit while testing. The bit shall be firmly engaged into the full depth of the test recess with end pressure not to exceed 20.5 pounds. Further, the bit shall be tested in the tightening direction only (clockwise) and should not exceed the specified value by more than 10% to prevent undue test block wear.

- c. Test must be continued for three minutes or failure, whichever occurs first. Tested bits which did not fail after three minutes must not be put back in the lot.

IV. ACCEPTANCE AND REJECTION

Accept lot if all bits inspected and tested meet the dimensional and physical test requirements of paragraph III. Reject the lot if the sample does not meet the requirements of paragraph III.

TORQ-SET® GAGES

Two-wing recess plug gages illustrated on print SG-112 are used to control recess dimensions of the finished product. The wing thickness of the "Go" plug is .001 less than the minimum wing thickness ("F" dimension) of the punch to allow for wear. This two-wing design aids in locating misfit conditions in the recess and is a simple and economical gage to produce. It is also used to check the fit in impressions of the punches in the course of incoming inspection.

A further refinement of the plug gage (SG-112) is the dial indicator penetration gage as shown on SG137. The penetration gage measures the actual depth of engagement of the SG-112 GO plug gage and is an excellent gage for the control of TORQ-SET® recess dimensions.

In addition to the functional check with the plug gage, the wings of the punch are checked independently with a micrometer and any wide discrepancies may be an indication of excessive radial misalignment of the wings.

INSTRUCTIONS FOR USE OF TORQ-SET® FALLAWAY GAGES

BACKGROUND:

Fallaway is a condition whereby the material of the screw head does not completely conform to the shape of the header punch that produced it. This is most apparent in the backoff wing walls of the TORQ-SET® recess, and in the extreme condition, results in poor recess torque delivery in the counter-clockwise direction.

Since it has been found impractical to measure this condition directly on the backoff wing walls, these gages were designed to measure the degree of fallaway of a related portion of the recess by measuring the size of the central opening at the head surface of curved top heads.

Two gage designs are provided using the same basic principle. One is a hand type gage utilizing a "flush pin" method of gaging. The other type is provided with a dial indicator for more accurate determination of fallaway.

LIMITATION:

The gage shall not be used for flat top heads (i.e 100° flat, flat pan, flat fillister) since the phenomenon of fallaway does not require control for these head styles.

DESCRIPTION:

Basically, each of these gages consist of an accurately prepared circular pin, mounted in a barrel assembly, which has been counterbored on the gaging face to the diameter of the TORQ-SET® recess for curved top heads. Since the recess size is different for each fastener size, a separate gage is provided for measuring fallaway for each screw size. However, since all curved top heads of the same screw size have the same recess diameter, one gage can be used to measure fallaway of any curved top head of the same shank size.

INSTRUCTIONS FOR USE OF TORQ-SET[®] FALLAWAY GAGES (cont'd)

PROCEDURE:

1. Select proper gage depending on recess size in fastener to be checked.
2. Zero gage on flat surface so tip of gage pin is flush with front face of the gage barrel.
 - a. For hand type gages, back end of gage pin should be flush with back end of barrel.
 - b. For dial indicator gages, adjust needle to 0 when zeroed as above.
3. Engage gage pin in center (core) opening of recess in head of fastener.
4. Maintaining axis of gage in alignment with axis of fastener, press gage body toward head of fastener, tending to retract gage pin against compression spring, until counterbore of gage body firmly contacts head surface of fastener.
5.
 - a. For hand type gages — If back end of gage pin is flush with or projects beyond back surface of barrel, fallaway is acceptable. If back end of gage pin is below flush with back surface of barrel, fallaway is excessive.
 - b. For dial indicator type gages, any reading above zero on dial (+) indicates acceptable fallaway. A reading below zero (–) indicates excessive fallaway.

METHOD OF COMPUTING TORQ-SET® PENETRATION VALUES FOR ALL HEAD STYLES

MAXIMUM PENETRATION = MAX. RECESS DIA. OF SCREW – MIN. POINT DIA. ON PLUG
PER SG112

2

MINIMUM PENETRATION = MIN. RECESS DIA. OF SCREW – MAX. POINT DIA. ON PLUG
PER SG112

2

– W

W = WEAR ALLOWANCE TO BE APPLIED TO MINIMUM PENETRATION AND IS .002
PER 1/16 OF NOMINAL SHANK DIAMETER.

Minimum penetration values shall be rounded off downward to the nearest one-half thousandth; for example, .0483 would be rounded off to .0480; .0419 would be rounded off to .0415.

These penetration values apply only to standard recesses in nominal size fasteners. Where smaller or larger recesses are substituted, the wear allowance shall be based on the nominal size for which the recess was originally designed.

EXAMPLE #1

#8 100° FLAT HEAD

.215 = MAX. RECESS DIA.
–.096 = MIN. PT. DIA. ON PLUG
2/.119
.0595 = MAX. PENETRATION

TORQ-SET[®] PUNCH INSPECTION

Header punches for TORQ-SET[®] fasteners are made to exacting standards from high quality punch steel and are heat treated for best consistency and performance in production. The following inspection procedure is recommended for receiving inspection by authorized TORQ-SET[®] producers.

Check one punch per lot or at least one per twenty-five punches of the same code or lot for the following attributes:

1. Punch diameter, length, retaining pin groove, hardness, etc. and other requirements to be inspected to the blueprint in accordance with standard procedures, except as noted below.
2. Recess fit, i.e. wing thickness (F), and alignment, to be checked using SG119 GO and SG112 NOGO Plug Gages. "NOGO" may enter up to one-half the depth of impression. A secondary functional check with a bit may also be employed.
3. Nib length ("J" dimension on flat head punches) to be checked with a micrometer. Extreme point or tip of punch may be rounded or flattened to the extent of .015 and in such cases "J" dimensions measuring .003 under minimum specifications will be acceptable.
4. Minimum flat on punch face to be checked with micrometers or calipers.
5. Spot check wing thickness with micrometers wherever possible.
6. Check point diameter "G" dimension with micrometer.
7. All punches to be scanned visually with 10X glass to check for obvious visual defects as cracks, chips, tears, folds, objectional flow lines, poor workmanship, etc.
8. All punches to be checked visually for proper code identification, product part number, grip marking, etc. where specified.
